

1 **ABSTRACT**

2 A water-preventing grommet for a pull chain switch has a cylindrical body
3 with an abutting end and an inclined distal end, a recess defined in the abutting end,
4 a downward passage defined in the inclined distal end to communicate with the
5 recess. The inclined distal end has a flat inclined face, a top extending portion and a
6 bottom guiding portion. The downward passage in the inclined distal end extends to
7 the bottom guiding portion. When the grommet is placed in at a right position, the
8 top extending portion shades the downward passage from rain drops. Meanwhile,
9 the downward passage also eliminates water up-flow to keep water away from the
10 pull chain switch.
